

“ I believe that when the best people come together and work towards a combined vision, great achievements can be reached. I am working day to day building the team, attracting investors and pilot customers to change the way electronics are developed. It was stuck in the past for too long. ”

**Tobias Pohl is the CEO of Celus.** He grew up in the small village of Heldenstein in Bavaria. After finishing his school education at the Gymnasium Gars in 2012 he started studying **Mechanical Engineering and Automotive Engineering** at the **Technical University Munich**.

In 2017 he graduated as a Master of Science. During his studies, he was a research assistant at the automotive chair. One of his tasks was to develop control units for an electric vehicle for the sub-saharan region. The differences in the development processes for software and hardware engineering got him thinking. He joined up with his brother, with whom he jointly pushed the idea of automating the electronics development processes.

After founding **Celus**, they were joined by a third founder, **André Alcalde**, and are now driving the revolution in electronics engineering.
